Altera

SCOPE STATEMENT

RETAILER	PERIOD	PREPARED BY	DATE
Harbour Market	12 months of sales	Altera AI	20 October 2026

1. Scope covered

- **30** products received in the Harbour Market catalogue file, sales over twelve months.
- **WWF: 27 products**, after the WWF exclusion list.
- **Protein Tracker: 29 products**, all food and drink.

OUT OF SCOPE	WWF	PROTEIN TRACKER	REASON
COCA COLA ORIGINAL CAN 33CL	out	in	WWF exclusion list, soft drink: excluded from WWF only
HEINEKEN LAGER 33CL	out	in	WWF exclusion list, alcohol: excluded from WWF only
LOTUS TOILET TISSUE AQUA TUBE X12	out	out	non-food: out of both scopes

2. Product-level approach

- Every product is classified individually, by its barcode: whole or composite, food group FG1 to FG7, plant or animal origin, sub-group; composites by category (meat-based, seafood-based, vegetarian, vegan).
- Classification sources: Altera reference database (14), then the language model (15), every field validated against the allowed vocabulary.
- Rules applied by the assembler: no food group on a composite, sub-groups only in FG1, FG2, FG3 and FG5, dairy factor ×10 reserved for cheese (1 product).

3. Data used

- Retailer catalogue file, 13 columns: barcode, labels, brand, department, segment, net weight, ingredients, nutrition values, units sold.
- Protein contents, each with its source: declared and checked (20), Altera reference database (3), Open Food Facts (4), CIQUAL (2). Sources: Open Food Facts and NEVO, plus the national table (CIQUAL in France).
- Plant / animal split: single origin (22), ingredient list (1), NEVO table (1), 50/50 convention (1), follows its group (1), no protein (3). Data level A: 97% of the protein.
- Every protein value is cross-checked against a second source: by barcode against Open Food Facts, by name against NEVO. A NEVO split is kept only when it agrees with the ingredient list; otherwise the 50/50 convention applies, at level B.

4. Volume assumptions

- Real volumes supplied by the retailer: consumer units sold over twelve months. No volume estimated.
- Mass sold = units × qualified net weight: 1,796 t on the Protein Tracker scope. One missing net weight was left empty at your request: that product is left out of the tonnes.
- Anomalies decided before calculation: an ingredient list of another product (kept as received), a missing net weight (left empty), a content entered per pack (kept as declared). The workbook's Data tab carries the source of every content.
- Open working assumptions: 3 values kept as received, to confirm with the retailer.
